

Rotation-dynamics moment residual vs the theoretical rotor ground-effect moment

137 runs · 5 configurations · both axes | $z_{\text{CoM}} = 267 \text{ mm}$, $J_P = 0.311 \text{ kg}\cdot\text{m}^2$, collective through $l_p = 130/100 \text{ mm}$ (Eq. 43), window capped at 5° absolute tilt — no free parameter
